TUTORIAL FOR MULTIVARIATE GLM ANALYSIS IN SPM8 – SOFTWARE ADAPTATION AND PROCEDURE

In this tutorial the necessary steps to perform a multivariate analysis in any computer with a Matlab version compatible with SPM8 are explained, assuming that the images are already spatially preprocessed.

- 1. Go to http://www.fil.ion.ucl.ac.uk/spm/software/spm8/ and download the latest version of SPM8 software.
- 2. After the installation process, go to http://www.uc.pt/en/fmuc/ibili/Archives/app/MultivariateGLM. The "MultivariateGLM" zip file will be automatically downloaded.
- 3. Extract the new functions (*spm_cfg_con, spm_cfg_factorial_design, spm_run_factorial_design, spm_conman, spm_contrasts, spm_design_factorial, spm_FcUtil, spm_getSPM, spm_leveneTest, spm_list, spm_MBoxtest, spm_results_ui, spm_spm)* from "MultivariateGLM" zip file and insert them in the spm8 folder. The first three functions must be pasted inside of the *config* folder. Note: we advise you to save the old functions before you overwrite them with the new ones. This will allow you to reset the toolbox anytime you want.
- 4. Start the Matlab program and write 'spm' in the command window. The following window will appear:

📣 SPM8 (Fabio Fe	erreira)		_		×	
	Statistica	l Parametric	Марріі	ng		
Md	developed by The Wellcome The Institute of Neuro	SPM8 y members and coll Trust Centre for blogy, University (aborators o • Neuroir College L	of naging ondon		
S	PET & VBM About SPM	M/EEG SPMweb	fMF Qu	રા it

5. Choose the 'PET & VBM' button and the following window will appear:

🦊 SPM8 (Fabio Ferre	-	-		×

Here it is possible to choose the directory where the SPM.mat file, with specified design matrix, will be written, as well as the intended design. In this case, choose the 'MANCOVA' design.

In this design, multiple dependent variables (DVs) can be chosen: it is possible to choose the name of the DV, associate with each DV the scans to analyze, as well as the number of levels and the nuisance covariates, among

other options.

- 7. After the insertion of all design specifications, click on the 'run' button () to create the SPM.mat file.
- 8. Go to the main window (PET & VBM window), press the 'Estimate' button and select the SPM.mat file created previously (this lead to the estimation of SPM.mat file).
- 9. Then click on 'Results' button and choose the estimated SPM.mat file. The contrast manager window will become visible:

📣 SPN	1 contrast manager			_		Х
	Selec	t contrasts				
	⊖ t-contrasts	○ F-contrasts	O M-contrasts	● all		
	#### {type} : name					
	001 {M} : MANCOV	A	^			
			v	Design mat	rix	
	Define new cont	rast Reset	Done	parameter estir	nability	
		Selected 0 co	ntrasts.			?

10. Select the 'M-contrasts' button and click on 'Define new contrast...' button:

📣 SPM contrast manager			_		Х
define contrast]_		_	
MANCOVA		asts	all		
type ○ t-con ○ F-con ● M-con		[contradsit(s)		
Contrast uniques weights we	.colonia .co		Design matrix		
Reset	OK		parameter estima	bility	
name defined, c	ontrast define	əd		[?

11. Here, the multivariate contrast can be defined. In the upper rectangle the contrast name can be inserted. In the second rectangle, the contrast weights to test the dependent variables can be inserted; the third rectangle requires the input of the contrast weights to test the independent variables. After this, press the 'submit' button and finally 'OK' button. In order to give the users a better understanding of the contrasts weights, we have made an example for you: we have two dependent variables (gray matter T1 and T2 images), two independent variables

(controls and diabetic patients) and one nuisance variable (total intracranial volume). The contrast $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ in the second rectangle will allow the model to calculate the joint effects of the two dependent variables (in this case, modulated gray matter a posteriori probability of T1 and T2 images) and the contrast $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ in the third rectangle will allow the model to compare the differences in gray matter volume between controls and diabetic patients, using the total intracranial volume as a covariate.

12. The contrast manager window will appear again. Select the created contrast and press 'Done'. The following window will appear:

🐠 SPM8 (Fabio Ferreira): Stats: Results	_	· 🗆	×		
apply masking	none				
title for comparison	MANCOVA				
p value adjustment to control	FDR none				
			?		

13. Insert the intended parameters for the analysis and press Enter. Wait until the end of the calculation and then you can choose an extent threshold (cluster size control):

15. After this a result such as the following one should appear:

Finally, in the results window, the previous result can be overlaid with a template. For this, click 'overlays...', select the tag 'sections' and then choose a template in the spm8 folder:

📣 SPM8 (Fabio Ferreir	– 🗆 X	
Design Contrasts		يد د

							Ŷ	

16. After all these steps, a similar result can be obtained:

THE EFFECT OF BOX'S M AND LEVENE'S TESTS IN SPM MAPS

Fig. (1). Voxels excluded by applying Box's M and Levene's tests before the estimation step.

Fig. (2). Voxels included by applying Box's M and Levene's tests before the estimation step.

Supplementary Material

Fig. (3). Areas with less grey matter volume and concomitant pathology in T2DM patients (p<0.001, uncorrected, extent threshold k = 10) when Box's M and Levene's tests were not used.
